where is that start quake walk button everybody is talking about?

Worked for a few seconds

ChatGPT said:

You said:

its not there in quick action.

Worked for 16s

ChatGPT said:

You said:

Yes but it works very well! Sadly now all the new layouts are in full chaos. Any other places the stuff that didnt work in the left toolbar could be put?

You said:

Sounds very good! Make it a nice and intuitive masterfully designed ui! People should esily get into flowstate using the app.

You said:

Ok i zipped it up myself and got it to install but its sadly kind of a mess. I
decided we wont go workspace for now. Lets go back to the last time when it was just the sidebar and uncutter it together piece by piece.

Thinking

You said:

stop! .17.7 is not the las sidebar only version! Please scan the ai chat history and find the last implementation before we went workspace.

Ok sat down and build a new outline for the sideboard. Short legend:

[im a button]
{im a drop down list}
{
im a collapsable section

```
}
"im infotmational text"
/* Im a coment */
```

So here is the outline:

```
{
   /* First section because it will be used the most. Thats the stuff that
   would profit from migrating to other parts of the ui or into circle menues
   or stuff like this but for now its fine here.
   */
   "NAVIGATION"
   [Toggle WASD Mode]
   [Move to Player Start]
}
{
   /*
   The Main section.
   First row has the Version Nr and a [settings] button. The button opens the
   blender text editor (in a separate window?) with the config file editable.
   Everything depending on stuff in the config file will be greyed out until
   the respective settings are set.
   {Game / Mod} is the same as established
   [Browse Game Maps] as well as [Import BSP] work as always but no additional
   settings in the open dialogue.
   The moment a level is imported the other settings get available and we are
   teleported to info_player_start. In the cool new FPS noclip mode you
   realized last time. We need a button som
   [Export BSP] Opens the export dialogue. The settings for classic and
   enhanced are still there but intelligently prechosen depending on the
   current lighmap resolution. If the resolution demands enhanced maps thats
```

```
    the preset output setting, otherwise classic is chosen. A third
option
    would be "both" where two versions are exported with _c and
_e suffices.
    [Open Last Export in Ironwail] does exactly that prefering the _e
suffix
    one if last export was a double export. (preference can be
switched i
    config) The lightmap resolution now is also displayed. Clicking
[change]
    opens a popup window with the usual warnings and a way to
select
    different  resolutions.
    */

    "MAIN"
    "VersionNr." [Settings]
    {Game / Mod}
    [Browse Game Maps]
    [Import BSP] [Export BSP]
    [Open Last Export in Ironwail]
    "Lightmap Resolution" [change]

    }
}
{
    /*
    The Ligting Section. In the first row we can chose the currently
displayed
    lighting version. [Original] sets  solid viewport shading
disabling scene
lighs and scene world and displays the imported lightmaps from
the bsp this
setting is automatically set after importing a map. [Eevee] also
chooses solid
viewport shading but enabeling scene lighs while disabeling the
source
lighmaps. [Cycles] changes to render view also enabeling scene
lights. [Baked]
changes to the settings of [original] but swiches the displayed
source lightmap
```

with those created by the [bake] button further down. If nothing was bake yet
this option is greyed out.
[Paint Texture] and [Paint Lightmap] do the same as established. But they are
kind of toggle buttons. They are greyed out until faces are selected in
edit mode. If so they take us to texture- or lightmap paint mode respectively.
If in one paint mode we can swich to the other by pressing its button or leave
paint mode by pressing the one we are currently in.
[Bake Lightmap] is only accessable in Evee or Cycles mode. It bakes the
lighting of the currently active lighing version to another lightmap "layer".

```
   */
   "LIGHTING"
   [Original] [Eevee] [Cycles] [Baked]
   [Paint Texture]
   [Paint Lightmap]
   [Bake Lightmap]
}
{
  "STATS"
  /* I kind of like the little map info statistic infos you smuggled into the
    ui. ;) Here is a place for stuff like that feel free to leave
   relevant and intesting data here.
}

/* All the rest will be removed. What Do you think? */
```

You said:

Yes i agree. The lighting stuff needs a lot of love but lets go section for section.
