Last time:

Next development priority

I'd tackle lightmap resolution as the next feature:

1. Preserve the original BSP lightmap unchanged.
2. Add configurable working resolution: 1×, 2×, 4× and 8×.
3. Resample the original lightmap into the higher-resolution working image.
4. Scale the lightmap UV coordinates consistently.
5. Keep the original-resolution atlas available for classic BSP export.
6. Later investigate enhanced export for engines supporting higher-resolution lightmaps.

I would keep the currently working painting code stable while developing this. We finally have a reliable foundation to build on! 😁

Thats the plan. But first lets shor talk about export:
bpy.context.space_data.params.filename = "test02_compile_surface_studio.bsp"
Face-ID attribute count no longer matches the mesh polygons.\

can i also start the python files from direcly inside blender? In general the qss is for quake and knows the quake folder. (It should become a permanent value in a config file instead of setting it everytime or better setting the id1 folder to begin with. That way we can also chose mods. So when in id1 access to maps could also be possible and the whole set of original maps should be there to for tests and experiments.

cant i just start a script from blender prompting me to chose a bsp and then rund your tests including the validator.

Implement it and then we start the testing. And while you're at it: the roughness value in the materials principaled BSDF shader is somehow .5 for all materials. It should be 1
